SYLLABUS

Academic Discipline “CHEMISTRY WITH FUNDAMENTALS OF BIOGEOCHEMISTRY”

Foe EQL (educational and skill level) “Bachelor”
Branch of knowledge – 10 Natural Sciences
Speciality – 101 Ecology

Syllabus compiled by: Associate Prof. L.V. Voitenko, PhD in Chemistry

Kyiv, 2017
The Working program _ Chemistry with Fundamentals of biogeochemistry _ for Students of Branch of knowledge – 10 Natural Sciences Speciality – 101 Ecology

“30” May 2017

The developer: L.V.Voitenko, Associate Professor of the Department of Analytical and Bioinorganic Chemistry & Water Quality, PhD in Chemistry

The Working program was approved at the meeting of the Department of Analytical and Bioinorganic Chemistry & Water Quality

Protocol # 9 “30” May 2017

Head of the Department of Analytical and Bioinorganic Chemistry & Water Quality, Dr.Chem.Sci, Prof. __________________________ (V.A.Kopilevich) (підпис) (прізвище та ініціали)

Approved by the Scientific Council of Plant Protection, the Biotechnologies, and Ecology Faculty

Protocol # _____ “____” ______________________ 2017

Head Dr.Agr.Sci, Prof. ______________ M.M.Dolya __________________________ (підпис) (прізвище та ініціали)

2. GOAL AND OBJECTIVES OF ACADEMIC DISCIPLINE

The study of the biological, geological and chemical factors that influence the movement of chemical elements through living systems across space and time. Processes can be studies at the microbial, ecosystem and global scales. Scales are becoming increasingly integrated. Biogeochemistry is the professional-oriented subjects. It is the component of the final stage of Bachelor’s professional education in the field of ecology and environmental protection. Work educational program was prepared basing into typical program “Biogeochemistry and Environmental chemistry” for specialty “Ecology and Environmental protection”, ratified by Main Administration of Cadre Policy and Agrarian Education of Agrarian Ministry of Ukraine 26.03.2003.

Biogeochemistry is the scientific discipline that involves the study of the chemical, physical, geological, and biological processes and reactions that govern the composition of the natural environment (including the biosphere, the hydrosphere, the pedosphere, the atmosphere, and the lithosphere). In particular,
biogeochemistry is the study of the cycles of chemical elements, such as carbon and nitrogen, and their interactions with and incorporation into living things transported through earth scale biological systems in space through time. The field focuses on chemical cycles which are either driven by or have an impact on biological activity. Particular emphasis is placed on the study of carbon, nitrogen, sulfur, and phosphorus cycles. Biogeochemistry is a systems science closely related to Systems ecology.

**The goal of the discipline:**

To study:
- General notions and laws of biogeochemistry;
- Biogeochemical cycles of main nutrients and pollutants;
- Student must can to do:
  - To take a samples of water, soil, air;
  - To prepare a sample to chemical analysis;
  - To make a few analyses of main nutrients and pollutants of drinking water et al.

**The objects of research (tasks) are:**

- To study the the laws of chemical composition of biosphere as the results of biogenic and a-biogenic processes;
- To explain the matter pass ways and migration of the chemical elements in the environment;
- To estimate of the environmental pollution, prognosis and simulating of pollutants behavior in biosphere;
- To establish the principles of biogeochemical zoning and reasons of biogeochemical anomalies resulted as endemic non-infection diseases;
- To study the theories of life origin and the possibilities to create “the artificial life” (nowadays data);
- To create the quantitative models of biogeochemical cycles of the macronutrients, micronutrients, toxic elements;
- To study the pass ways and species of biogenic and anthropogenic migrations of the chemical elements;
- To study the nature and mechanisms of the isotope fraction by living matter;
- To establish the role of living matter in geochemical processes of hypergenesis and weathering crust;
- To study the biogeochemical regularities based on the bio-indication methods of environmental monitoring;
- To develop the recommendations for preventing of environmental anthropogenic pollution.

**Requirements to the knowledge and skills**

**Student must to know:**

- General notions and laws of biogeochemistry;
- Biogeochemical parameters of chemical elements cycling;
- Physiological influence of chemical elements on life matter;
- Modern ideas of ecosphere developing and its transformation in noösphere;
Methods of environmental sanitation based on biogeochemical features and their practical application;
Chemical parameters of environmental state and preventive methods of its pollution;
Chemical and physical methods of environmental monitoring.

**Student must to be able to do:**
- To analyze the scientific and applied literature sources in biogeochemistry;
- To know how to use the normative documents in the field of environmental regulations;
- To know statistic treatment of experimental results in environmental monitoring.

**Student must to have practical skills:**
- To use standard chemical and physical-chemical analyses for the determination of qualitative and quantitative composition of different objects of geochemical environment (soils, water, air, foods etc.);
- To know the probe sampling procedures and the ordinary operations of chemical analysis;
- To use modern analytical equipment, including express analyzers for field experiment;
- To prepare equipment, glassware, reagents for analysis;
- To know safe rules in chemical lab.

**Pre-required courses**

**Content module # 1 Biogeochemical characteristics of the ecosphere composition**

**Chapter 1.** Introduction. The object of research and the goal of the discipline. Life origin on the Earth: hypotheses and experimental.  
20 4 6 10

**Chapter 2.** The ecosphere, the chemical elements and biogeochemical laws  
20 4 6 10

**Chapter 3.** Biogeochemical zoning  
14 4 10

**Chapter 4.** Endemic diseases  
18 4 4 10

**Sum of content module 1**  
72 16 16 40

**Content module # 2 «Biogeochemical cycles of the main bioactive chemical elements»**

**Chapter 1.** The general notions of biogeochemical cycles. Experimental modeling data.  
26 4 22

**Chapter 2.** Biogeochemical cycles of macronutrients and toxic elements  
52 8 14 30

**Chapter 3.** Biogeochemical barriers  
12 2 10

**Sum of content module 2**  
90 14 14 62

**Total, hours**  
162 30 30 102

**Course work**  
Doesn’t planned

**Content module # 1 Biogeochemical characteristics of the ecosphere composition**

**Lecture # 1 annotation**

Modern directions of biogeochemistry. The environmental protection as a social factor.

**Lecture # 2 annotation**

**Lecture # 3 annotation**

**Lecture # 4 annotation**

**Lecture # 5 annotation**
Bioactive elements distribution in biosphere. Examples of geochemical role of life matter (calcium, iodine functions, atmospheric oxygen, formation of manganese-nickel concretions etc.). Biogeochemical functions of life matter.

**Lecture # 6 annotation**
Biogeochemical zoning as an unity of geochemical environment and functioning of life matter (according to V.V. Kowalsky). Biogeochemical chains. Biogeochemical provinces and zones (taiga-forest non-chernozemic; forest-steppe and steppe chernozemic; dry-steppe; semiarid and desert; mountain).

**Lectures # 7-8 annotation**

**Content module # 2 Biogeochemical cycles of the main bioactive chemical elements”**

**Lecture # 9 annotation**
The basic notions of biogeochemical cycles. Processes of cycling migration of chemical elements in environment. Fluxes and reservoirs of biogeochemical
cycles. Thermodynamics laws and biogeochemical cycles. Experimental evidences of cycling (Witherspoon radioisotope experiment; Habbard-Brook experimental forest study). Exogenic and endogenic cycles.

**Lecture # 10 annotation**

**Lecture # 11 annotation**

**Lecture # 12 annotation**

**Lecture # 13 annotation**

**Lecture # 14 annotation**
Biogeochemical cycles of Mercury, Cadmium, Lead. Technogenic migration of heavy metals in environment. Techno sphere and its properties.

**Lecture # 15 annotation**

4. No seminars.

5. No practice lessosns.

7. CONTROL TESTS
   Final test (example)

Завдання

1. Describe the Vernadsky Biogeochemical Laws. Illustrate the idea of ‘all-over” of life (“black smokers”, “moon milk”, “blood fall” etc.).

2. Comment the results on nitrates content monitoring in The Hubbard Brook Experiment (see figures)
1. Note the equation of reaction described the chemosynthesis process which is an energy source for anaerobes

\[
\begin{align*}
A &: 3\text{CH}_3\text{O} + \text{H}_2\text{O} = \text{CO}_2 + 2\text{CH}_3\text{OH} \\
B &: 4\text{NO}_2 + \text{O}_2 + \text{H}_2\text{O} = 4\text{HNO}_3
\end{align*}
\]

2. Note the chemical element which is a central in the cycling of chemical elements in biosphere (according to Zavarsin, 1998):

<p>| | | | | |</p>
<table>
<thead>
<tr>

<td>N(_2)</td>
<td>C</td>
<td>CO</td>
<td>E</td>
</tr>
<tr>
<td>B</td>
<td>H(_2)S</td>
<td>D</td>
<td>CO(_2)</td>
<td>F</td>
</tr>
</tbody>
</table>

Answer: ______________

**Question 2.** Describe the examples of extremely ecosystems illustrated the Vernadsky’s term «all over» propagation of life on the surface of the Earth (at least two examples) (2 points)

**Question 3.** Note the main dangerous result of drinking water chlorination (1 point)
A Bad water odor and taste  
B Formation of by-products – Trihalomethanes and other chloroderivates of cancer activity  
C Corrosion of water pipes  
D The risk of any leakage of gaseous chlorine for water treatment plants

Question 4. Insert the missing word: First biogeochemical law - biogenic ________ of chemical elements in the biosphere tends to its maximum development (1 point).

Question 5. Using data about the atmospheric transparency in Infra red spectra (see picture), note the substances (excepting carbon dioxide) which are the absorbers of IR radiation (Answer – as the chemical formulas) (2 points)

Question 6. Note the maximum permitted limit of total and free residual chlorine content of drinking water according to the requirements of DSanPiN 2.2.4-171-10 (two figures and unit of concentration) (2 points).

Question 7. Why is no reason to include the dissolved oxygen content as the parameter of the drinking water quality for human consumption? (Answer – as a sentence) (1 point)

Question 8. What is the name of American social activist and former US Vice President, who received in 2007 the Nobel Peace Prize for a campaign against the "greenhouse effect" (1 point)

Question 9. What type of drinking water pollution and its duration is a cause of “blue baby” syndrome? (1 point)

A Chronic toxicity of nitrates  
B Acute poisoning of nitrates  
C Chronic toxicity of ammonia  
D Acute poisoning of nitrites  
E Acute poisoning of ammonia

Question 10. The Muller-Urey experiment was a reason of the life origin theory: (1 point)

A Panspermia  
B Creationism  
C Spontaneous generation  
D Biochemical evolution (Oparin-Haldane’s)  
E The RNA world

Answer: ____________________

Question 11. Insert the missing word: Second Biochemical law - the evolution of species, leading to the creation of life forms that are stable in the biosphere should be in the direction, ________ expression of the biogenic migration of atoms in the biosphere. (1 point)

Question 12. Describe the risks to human health associated with chlorination of drinking water for its disinfection (answer as the sentences) (2 points)

Question 13. Note the main sources of underground water pollution of nitrates in Ukraine (2 points)

Question 14. Note relationship of accuracy versus precision for the next situation (high, low) (1 point):
Answer: ______ accuracy, ______ precision

**Question 15.** Note analytical method used for the residual chlorine content in drinking water of express-method (Colorimeter C.401, for example) *(1 point)*

**9. TEACHING METHODS**

Before teaching a course, the instructor must identify what she or he intends for the students to learn. For most analytical chemistry instructors, this usually involves an assessment of what methods and techniques to include and at what depth to cover them. There are many other skills, though, that will be important to students for their future success. Most university classes in analytical chemistry are taught in a lecture format. An alternative to lecturing is the use of cooperative learning. Cooperative learning offers the potential to develop skills such as teamwork, communication, and problem-solving that are more difficult to impart in a lecture format. The laboratory component of analytical chemistry courses is often an underutilized learning resource. More often than not, the lab is used to demonstrate fundamental wet and instrumental analysis techniques and develop rudimentary laboratory skills. The analytical lab should also be used to develop meaningful problem-solving skills and to demonstrate and have students participate in the entire analytical process.

A teaching method comprises the principles and methods used for students teaching. Commonly used teaching methods for studying subject “Analytical chemistry” include on-time participation, demonstration, recitation, memorization, or combination of these. The choice of teaching method or methods to be used depends largely on the information or skill that is being taught, and it may also be influenced by the aptitude and enthusiasm of the students.

**Explaining, or lecturing,** is the process of teaching by giving spoken explanations of the subject that is to be learned. Lecturing is often accompanied by visual aids to help students visualize an object or problem.

**Demonstrating** is the process of teaching through examples or experiments. For example, a chemistry teacher must teach an idea by performing an experiment for students. A demonstration may be used to prove a fact through a combination of visual evidence and associated reasoning.

Demonstrations in analytical chemistry and own experiment are permit to obtain experimental skills needed for environmental monitoring etc. Memorization of a list of facts is a detached and impersonal experience, whereas the same information, conveyed through demonstration, becomes personally relatable. Demonstrations help to raise student interest and reinforce memory retention.
because they provide connections between facts and real-world applications of those facts. Lectures, on the other hand, are often geared more towards factual presentation than connective leaning.

**Collaboration** allows students to actively participate in the learning process by talking with each other and listening to other points of view. Collaboration establishes a personal connection between students and the topic of study and helps students think in a less personally biased way. Group projects and discussions are examples of this teaching method. Teachers may employ collaboration to assess students’ abilities to work as a team, leadership skills, or presentation abilities.

**Collaborative discussions** can take a variety of forms, such as fishbowl discussions. After some preparation and with clearly defined roles, a discussion may constitute most a lesson, with the teacher only giving short feedback at the end or in the following lesson.

Learning by teaching in the method, when students assume the role of teacher and teach their peers. Students who each others as a group or as individuals must study and understand a topic well enough to teach it to their peers. By having students participate in the teaching process, they gain self-confidence and strengthen their speaking and communication skills.

### 10. FORMS OF CONTROL

The main forms of knowledge control are control at the lectures at labs and workshops, outside the classrooms, and the consultations, tests and exams.

I. Control of the lectures can be conducted as a selective oral questioning of students or tests using the previously laid material, particularly in sections of the course that are necessary for the understanding of the lecture topics, read, or to establish a degree of mastery of the material lectures (held by the manner of the late first or early second hour lectures). Testing during lectures designed to teach students to systematic elaboration covered material and prepare for the upcoming lectures, establish the degree of assimilation theory to identify the most difficult students to read chapters from the following explanation of them. Control of the lectures has to subtract time. By spending time to control oral examination yields control, programmable for cards.

II. Current control on laboratory studies conducted to elucidate ready students for employment in the following forms:

1. Writing (30 min.). Control work.
2. Colloquium on separate sections of theoretical courses (modules or themes).

III. Credits. Some subjects (theoretical courses, practical training) is applied differential test of performance appraisal on a five point scale. In a lecture course or its individual parts, which are not accompanied by laboratory or practical classes, the teacher may conduct interviews or colloquium, offer oral or written questions. Often, students are subject to crediting as a minor, insignificant and do
not give enough time to prepare for it. Of a major courses before credit of colloquium useful.

Term papers are the product of many days of work. They include elements of scientific research. Protecting course work – a special form of offset in the commission of two or three teachers. Best of course work submitted for scientific student conference.

IV. Examinations. Exam is a final step in the study of the whole or part of the discipline and are designed to test students’ knowledge on the theory and identify the skills apply the acquired knowledge in solving practical problems, as well as independent work skills with educational and scientific literature.

Student’s rating of knowledge of an academic discipline consists of training work rating – 70 points and final attestation – 30 points. Thus, rating of content modules, that are consistuents of an academic discipline, makes 70 points. Rating of content modules as well as attestation rating are also measured by 100-point-scale.

Assessment and grading

11. TECHNOLOGY AND METHODOLOGICAL REQUIREMENTS

У робочому навчальному плані передбачено в одному навчальному семестрі лекцій – 30 годин, лабораторних занять – 45 годин та самостійної роботи - 98 годин, що в сумі становить 173 годин (6 кредитів ECTS).

Тривалість навчального семестру – 15 тижнів.

Відповідно до «Положення про кредитно-модульну систему навчання в НУБіП Україні», затвердженого ректором університету 03.04.2009 р., рейтинг студента з навчальної роботи \( R_{нр} \) стосовно вивчення певної дисципліни визначається за формулою

\[
R_{нр} = \frac{0.7 \cdot (R^{(1)}_{3м} \cdot K^{(1)}_{3м} + \ldots + R^{(n)}_{3м} \cdot K^{(n)}_{3м})}{K_{дис}} + R_{дп} - R_{штр},
\]

где \( K_{дис} \) – коефіцієнт дископодібності.
де $R^{(1)}_{zм}, \ldots R^{(n)}_{zм}$ – рейтингові оцінки змістових модулів за 100-бальною шкалою; 
$n$ – кількість змістових модулів; 
$K^{(1)}_{zм}, \ldots K^{(n)}_{zм}$ – кількість кредитів ECTS, передбачених робочим навчальним планом для відповідного змістового модуля; 
$K_{дис} = K^{(1)}_{zм} + \ldots + K^{(n)}_{zм}$ – кількість кредитів ECTS, передбачених робочим навчальним планом для дисципліни у поточному семестрі; 
$R_{др}$ – рейтинг з додаткової роботи; 
$R_{штп}$ – рейтинг штрафний. 
Наведену формулу можна спростити, якщо прийняти $K^{(1)}_{zм} = \ldots = K^{(n)}_{zм}$. Тоді вона буде мати вигляд:

$$0,7 \cdot (R^{(1)}_{zм} + \ldots + R^{(n)}_{zм})$$

$$R_{штп} = \frac{R_{штп}}{n}$$

Навчальне навантаження студента для їх вивчення та засвоєння складає:

1-й модуль ($R_1$) – 1,0 кредит ($K_1$)
2-й модуль ($R_2$) – 1,0 кредит ($K_2$)

Критерії оцінки змістових модулів:

$R_1$ складається з 4-х лабораторних робіт, самостійної та контрольних робіт. Захист лабораторних робіт та виконання самостійної роботи оцінюються від 5 до 10 балів кожна. Модульна контрольна робота 1 оцінюється від 0 до 20 балів кожна.

$R_2$ складається з 2 лабораторних робіт, самостійної та контрольних робіт. Захист експериментальної роботи та виконання самостійної роботи оцінюються від 5 до 10 балів кожна. Модульна контрольна робота № 2 оцінюється від 0 до 20 балів кожна.

Рейтинг з додаткової роботи $R_{др}$ додається до $R_{штп}$ і не може перевищувати 10 балів. Він визначається лектором і надається студентам рішенням кафедри за виконання робіт, які не передбачені навчальним планом, але сприяють підвищенню рівня знань студентів з дисципліни.

Рейтинг штрафний $R_{штп}$ не перевищує 3 балів і віднімається від $R_{штп}$. Він визначається лектором і вводиться рішенням кафедри для студентів, які матеріал змістового модуля засвоїли невчасно, не дотримувалися графіка роботи, пропускали заняття тощо.

Для допуску до атестації студенту необхідно набрати з навчальної роботи не менше 60% з кожного змістового модуля, а загалом не менше, ніж 42 бали з навчальної роботи. 

Реальний рейтинг з дисципліни $R_{дис}$. Визначається за формулою:

$$R_{дис} = R_{штп} + R_{ат}$$

Форма контролю – іспит.

Атестації з дисципліни в цілому оцінюються за 100 бальною шкалою згідно ECTS.
